```

This sequence was finished as follows unless otherwise noted: all regions were double stranded, sequenced with an alternate chemistries or covered by high quality data (i.e., phred quality >-30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by sequence from more than one ml3 subclone. The analyses of ribosome binding sites and promoter binding sites were kindly provided by Heladia Salgado, Julio Collado-Vides and http://kinich.cifn.unam.mx:8850/db/regulondb_intro.frameset

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         on Nov 10, 2000 this sequence version replaced gi:9802827. All repeats were identified using RepeatMasker: Smit, A.F.A. & Green, P. (1996-1997) http://ftp.genome.washington.edu/RM/RepeatMasker.html
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            NOTE: This is a 'working draft' sequence. It currently consists of 52 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N. but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence the available and the accession number will

```
This sequence represents a beta-lactam resistance (blr) gene from Escherichia coli. The blr gene encodes a 41 amino acid transmembrane protein (also designated Beta Lactama 358 in the specification) with a molecular weight of 4556 Daltons which confers resistance to beta-lactam antibiotics. The blr gene was initially identified in a 602 bp hypothetical intergenic region of the genome of an antibiotic-susceptible strain of E. coli, RW553. In the RW583 strain, the blr gene is disrupted by insertion of the transposon mini-Taphoa. A clone bearing an ORF (open reading frame)-containing 358 bp segment of the "intergenic" region was found to restore beta-lactam resistance in RW358. Certain amber mutations introduced into the 358 bp clone were found to abolish beta-lactam resistance and resistance could be restored using an amber suppressor, indicating that a protein encoded by the clone was responsible for mediating beta-lactam resistance. It is suggested that

                                                                                                                                                                                                                                                                                                                                                                                                                                                                         the BLR protein may act by increasing a beta-lactamase activity in a cell, possibly being a component of an uncharacterised membrane-bound efflux pump capable of expelling beta-lactams from the periplasm. The BLR protein may be used in methods to identify compounds that modulate antibiotic resistance in a bacterium. The BLR protein, gene, BLR agonists or antagonists, and anti-BLR antibodies may be used to treat bacterial infection, particularly by an organism resistant to antibiotics that affect peptidoglycan synthesis. They may also be used in screening assays, in vaccines, and in diagnostic assays. BLR nucleotides are useful in gene therapy applications to modulate BLR expression, and to detect BLR expression in a biological sample.
